BERMAD Waterworks

Pressure Reducing Valve

with Check Feature

- Flow and leakage reduction
- Cavitation damage protection
- Return flow prevention
- Throttling noise reduction
- Burst protection

The Model 720-20 Pressure Reducing Valve with Check Feature is a hydraulically operated, diaphragm actuated control valve that reduces higher upstream pressure to lower constant downstream pressure regardless of fluctuating demand or varying upstream pressure. The check feature prevents reverse flow through the valve.

700 Series Model 720-20

Features and Benefits

- Line pressure driven Independent operation
- Check feature
 - Replacing line sized check valve
 - Cost effective pumping
 - One-way zonal back-up
- In-line serviceable Easy maintenance
- Double chamber design
 - Moderated valve reaction
 - Protected diaphragm
- Flexible design Easy addition of features
- Variety of accessories Perfect mission matching
- "Y" or angle, wide body Minimized pressure loss
- Semi-straight flow Non-turbulent flow
- Stainless Steel raised seat Cavitation damage resistant
- Obstacle free, full bore Uncompromising reliability
- V-Port Throttling Plug Low flow stability

Major Additional Features

- Solenoid control & check valve 720-25
- Downstream over pressure guard 720-20-48
- High sensitivity pilot 720-20-12
- Electrically selected multi-level setting 720-20-45
- Electronic multi-level setting, Type 4T 720-20-4T
- Automatic regulation override 720-20-09

See relevant BERMAD publications.

700 Series Model 720-20

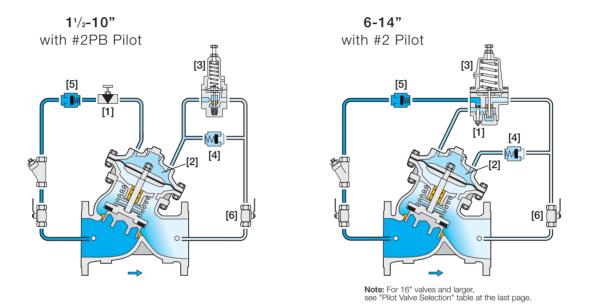

Operation

The Model 720-20 is a pilot controlled valve equipped with an adjustable, 2-Way, pressure reducing pilot and two check valves. The needle valve [1] continuously allows flow from valve inlet into the upper control chamber [2]. The pilot [3] senses downstream pressure.

Should this pressure rise above pilot setting, the pilot throttles, enabling pressure to accumulate in the upper control chamber, causing the main valve to throttle closed, decreasing downstream pressure to pilot setting.

Should downstream pressure exceed upstream pressure, check valve [4] allows downstream pressure into the upper control chamber while check valve [5] traps this pressure, together closing the main valve.

The needle valve controls the closing speed. The downstream cock valve [6] enables manual closing.

Engineer Specifications

The Pressure Reducing Valve with Check Feature shall reduce higher upstream pressure to lower preset downstream pressure regardless of fluctuating demand or varying upstream pressure and shall prevent reverse flow.

Main Valve: The main valve shall be a center guided, diaphragm actuated globe valve of either oblique (Y) or angle pattern design. The body shall have a replaceable, raised, stainless steel seat ring. The valve shall have an unobstructed flow path, with no stem guides, bearings, or supporting ribs. The body and cover shall be ductile iron. All external bolts, nuts, and studs shall be Duplex® coated. All valve components shall be accessible and serviceable without removing the valve from the pipeline.

Actuator: The actuator assembly shall be double chambered with an inherent separating partition between the lower surface of the diaphragm and the main valve. The entire actuator assembly (seal disk to top cover) shall be removable from the valve as an integral unit. The stainless steel valve shaft shall be center guided by a bearing in the separating partition. The replaceable radial seal disk shall include a resilient seal and shall be capable of accepting a V-Port Throttling Plug by bolting.

Control System: The control system shall consist of a 2-Way adjustable, direct acting, pressure reducing pilot valve, a needle valve, isolating cock valves, and a filter. All fittings shall be forged brass or stainless steel. The assembled valve shall be hydraulically tested and factory adjusted to customer requirements.

Quality Assurance: The valve manufacturer shall be certified according to the ISO 9001 Quality Assurance Standard. The main valve shall be certified as a complete drinking water valve according to NSF, WRAS, and other recognized standards.

BERMAD Waterworks

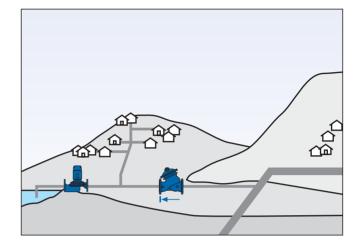

700 Series Model 720-20

Typical Applications

Cost Effective Pumping

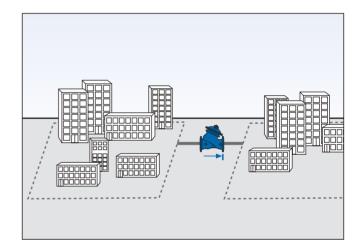

One zone of a distribution network has two supply sources. Setting the Model 720-20 Pressure Reducing Valve with Check Feature slightly higher than pump pressure, ensures pumping only when pressure provided from the network is insufficient.

- The Model 720-20:
- Protects the zone from excessive network supply pressure
- Saves energy and lowers costs by off-hours pumping

One-way Zonal Backup

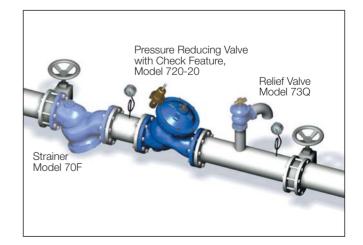

The Model 720-20 Pressure Reducing Valve with Check Feature, installed between two pressure zones, permits one zone to backup pressure supply to another zone while preventing reverse flow.

Typical Installation

In addition to the Model 720-20 Pressure Reducing Valve with Check Feature, BERMAD recommends the system also include:

- Strainer Model 70F, preventing debris from damaging valve operation
- Relief Valve Model 73Q, providing:
 - Protection against momentary pressure peaks
 - Visual indication of need for maintenance

For more information on BERMAD Pressure Reducing Systems, see BERMAD publication 720, Pressure Reducing Valve.
